BIM Component  
User Guide

Thank you for downloading this Modux BIM component. This user guide has been included to provide guidance on how to correctly use and make the most of the content.

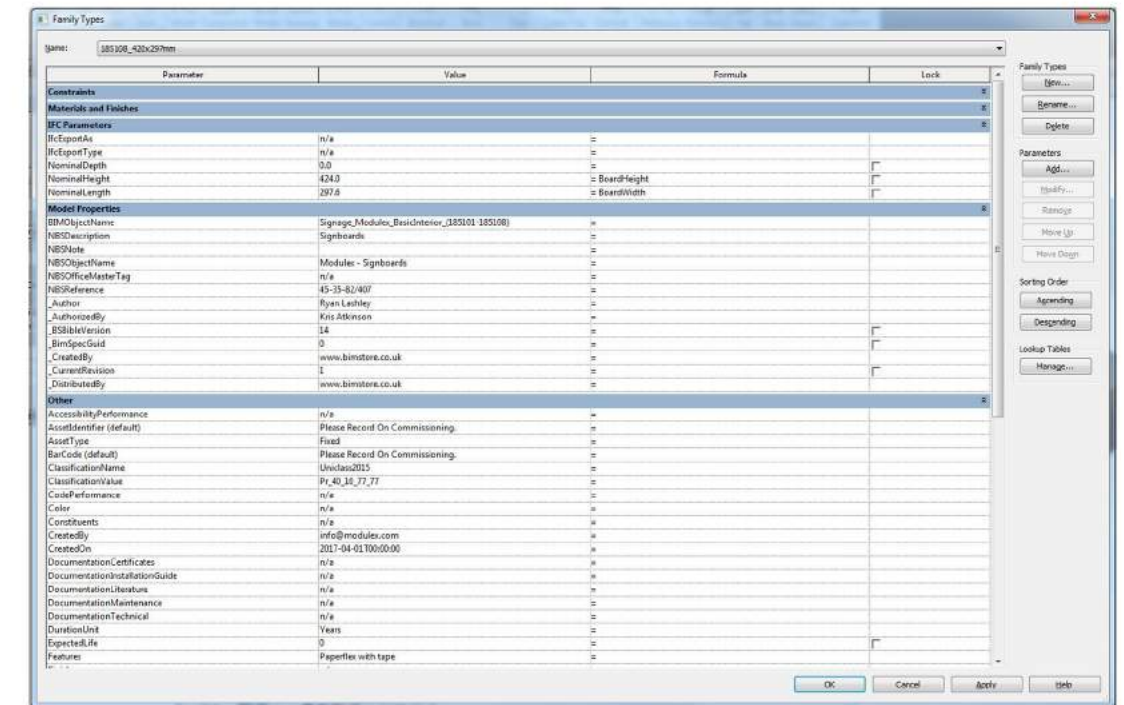

The Modulex SKUs have been modelled as face based generic model families that can be simply loaded in to your project. This can be done using the following method:

1. Open your Revit project file (.rvt), and navigate to a an appropriate view (e.g. floor plan)
2. Now open the component (.rfa) you have just downloaded from bimstore. Use the Revit ribbon at the top of the screen to navigate to the 'family editor' and click the 'Load into Project' button.

3. The component can now be placed in your project and can also be selected from the 'components' drop down on the main Revit ribbon.
4. The component is now embedded into your project file. You can remove it by using the purge tool.

The families contain a host of technical and manufacturer specific data to assist the user when building up their project or when scheduling. To access the data embedded into the families, simply select the desired component and click the 'Edit Type' button at the head of the 'Properties' tab. All this information can be scheduled including URL links direct to the manufacturer and to the documentation links of the product.

Other Notes

You can add the components to your company template file, they will then be available without loading when starting a new project.

## Revisions

Version 1.0

# Local and global

Modulex has a well-established network of well-trained partners all over the world.

The combination of their skills and knowledge with our strong product range allows our partners to manage a project from design to implementation – regionally, nationally and internationally.

Ask our consultants. And let them propose an optimal solution for you and your company.
